Re: LPFM Proceeding, MM Docket No. 99-25

Dear Ms. Dortch:

Common Frequency ("CF") previously submitted a letter and study on September 28, 2010 to the FCC concerning the shortcomings of implementing a ten application processing cap for pending translators in Auction No. 83. Since then a smattering of comments on translator processing and questions regarding the comment have beckoned CF to provide further clarification in this follow-up. In this comment, CF responds to questions about our earlier study, addresses the proposals from other parties, and provides a second study with a more exhaustive methodology to provide better insight on our position.

The translator preclusion study submitted by CF was produced to communicate that the ten application cap did not appear effective at providing more opportunity for LPFM in urban areas. At the heart of the matter, in our simulation, if ~97% of the top 150 urban MXs are taken by translators then there would be no difference in these urban markets **if there was a ten application cap or was no ten application cap.**

Although we additionally expressed that very few channels would be left for LPFM in major urban areas—a generalization that could require the processing of further data on CF's part to be exact—this observation is **separate** from reporting that 97% of *the top urban MXs* being consumed, which was foremost reported in CF's executive summary. The latter topic focuses on the efficacy of a ten application processing cap that was suggested within the *Third Report and Order and Second Further Notice of Proposed Rulemaking of Creation of A Low Power Radio Service*, MM Docket No. 99-25 ("LPFM Order").

The FCC made it clear in the LPFM Order that the ten application processing cap, in addition to contour-based methodology, was proposed to remedy the impact of Auction No. 83 for LPFM availability. This was emphasized directly within the LPFM Order:

Although precise preclusionary calculations are not possible, we believe that processing all of the approximately remaining 7,000 translator applications would frustrate the development of the LPFM service and our efforts to promote localism.¹ [underline added for emphasis]

In order to further our twin goals of increasing the number of LPFM stations and promoting localism, we find it necessary to take action. Accordingly we will limit further processing of applications submitted during the auction no. 83 filing window to ten proposals per applicant.² [underline added for emphasis]

As demonstrated by the filing of over 13,000 applicants in the 2003 filing window for the new non-reserved band FM translator construction permits, adoption of this standard would vastly expand LPFM licensing opportunities throughout the nation and create the possibility of locating new LPFM stations in a number of major and spectrum congested markets.³ [underline added for emphasis]

The FCC appears to have prescribed the cap to “increase the number of LPFM stations” and elected the use of contour based methodology to license “new LPFM stations in a number of major and spectrum congested markets.” Thus, if the ten application processing cap has little or no forecasted efficacy, it would be in the public interest to optimize that policy.

Frequency Availability in Markets

The FCC enacted a translator processing cap because **there were not ample urban channels for LPFM outside of the pending Auction No. 83 application pool of mutually exclusive channels.** The earlier CF study did not formally study the availability of LPFM frequencies outside those applied for by Auction 83 translators. The study was intended to consider the efficacy of the ten cap of translator applications on preserving LPFM availability, and demonstrated that the ten cap does not, in fact, achieve this. **No other data has been presented to contradict this conclusion. If the processing cap would not accomplish its intended goal, the Commission must consider alternatives, using the sentiment within the LPFM Order as the guiding policy for further translator processing.** That sentiment is the “twin goals of increasing the number of LPFM stations and promoting localism” by “limit[ing] further processing of applications”.⁴

CF realizes that translator applicants are eager for the FCC to process the remaining applications. However, those seeking to serve their communities with LPFM stations have waited even longer. Abandoning the sentiment conveyed in the LPFM

¹ Paragraph 53, *Third Report and Order and Second Further Notice of Proposed Rulemaking of Creation of A Low Power Radio Service*, MM Docket No. 99-25.

² Paragraph 56, *Ibid.*

³ Paragraph 79, *Ibid.*

⁴ *Supra.* Footnote 2.

Order simply to rush a decision will not serve the Commission's goals or these communities.

In the simulation below, CF pursued a second simulation, providing insight into LPFM channel availability in seven separate markets after a ten translator application cap has been employed by the FCC. The study examines all the commercial channels in the immediate core city area of each specified radio market. Because these studies are labor intensive, seven markets were preliminarily selected for study here, with more studies submitted later if needed.

Like CF's previous study, we again selected ten applications per applicant, but this time we chose one selectee per engineering-based MX and dismissed the rest of the applications in each MX. CF then viewed the contours of each existing commercial radio channel, looking for contour-based LPFM frequency openings (30 m HAAT at 0.1 kW, omnidirectional antenna) in the central cities. Note that contour-based (Section 74.1204) methodology is a more liberal approach to finding available channels. **If CF used the current distance-spacing regulations currently on the books, this would result in fewer useable LPFM channels being found.**

Appendix A lists the channel studies of the markets New York, Los Angeles, Chicago, San Francisco, Houston, Seattle, and Portland (the applications with strike-through represent applications that were dismissed in the MX). Within the spreadsheet, columns nine and ten report (contour based) LPFM channel availability. **Table**, below, summarizes the results.

Market	Existing Commercial Translators	2003 Translators Awarded After the Ten Cap	Existing LPFMs	Total Translators (Existing & Ten Cap Simulation)	Viable Channels for LPFM after Ten Cap Simulation	Marginal Channels for LPFM after Ten Cap Simulation
New York	2	13-14	0	15-16	1*	
Los Angeles	0	8	0	8	0	
Chicago	3	7	0	10	1	2**
San Francisco	3	6	0	9	2***	
Houston	2	8	0	10	2****	
Seattle	5	8	0	13	1	1*****
Portland	9	7	0	16	0	2*****

Table: Select City Simulations: Translator/LPFM Use in Immediate City. LPFM availability is listed in last two columns.

Footnotes regarding channels found for LPFM use

- * Not in Central New York City—but Brooklyn towards Coney Island
- ** One directly Lake Michigan with incoming full power interference, one with limitation
- *** Possible near Daly City (Southern edge of San Francisco), one near Pacific Coast.
- **** One with possible I.F. issue.
- ***** Possible strong incoming interference from co-channel full power and Tacoma co-channel translator.
- ***** One in the **east metro**, possible co-channel interference; one in **east suburb** to protect west suburb LPFM, none seen downtown.

Average total translators per market
(15 + 8 + 10 + 9 + 10 + 13 + 16)/ 7 = 11.6 per central market

Average possible LPFM
(1 + 0 + 3 + 2 + 2 + 2 + 2) = 1.7 per available in market

Total translators projected for each market average in the double digits. Total LPFM availability hovers at one to two, with some cities not being able to accommodate central city LPFMs.

For many markets, estimating LPFM availability with contour (“translator”, or Section 74.1204) methodology is a complex process. Because translator methodology can ignore varying degrees of incoming interference generalized by F(50,10) contours, actual interference received and imparted does not always infer black and white availability. Under a scenario in which translator applications are processed first, translator applicants get first pick of the “low hanging fruit” channels—channels that interfere less with established full power stations. In our tested markets, LPFM got the “scraps” of remaining usable channels. These channels could become liabilities for both the LPFM applicants and the FCC. With some of these LPFM channels licensed within the full power station’s co-channel 40 dBu F(50,10) contours, disputes with full power licensees could be inevitable in certain cases, and LPFM predicted service areas could be curtailed in other cases.

In addition to the threat of analog interference, perceived LPFM interference to HD channels could result in increased litigation. For example, KZFX-LP in Fall City, Washington, has applied for a second adjacent channel since it was displaced by encroachment. That application is already being challenged due to theorized **second adjacent** LPFM interference to a full power station’s HD signal. Further south, Portland, Oregon is already facing displaced Class D, regional (not-Portland specific) LPFM encroachment, and translator displacement due to full power licensees moving from rural to urban communities of license. **There simply are not enough channels to accommodate a large amount translators licensed from Auction No. 83, followed by an LPFM filing window.**

It is important to realize that all secondary service channels do not exist with equal amounts of interference. If translator applicants obtain the first ten open secondary service channels in a market (the “low hanging fruit”), the remaining channels could have more complex interference properties.

Regarding Comments of NPR

The October 12, 2010 letter from NPR to Marlene H. Dortch regarding MM Docket No. 99-25 NPR attempts to discredit CF’s study by commenting on key attributes of it (italics summarize NPR’s critique, followed by a response from CF).

- 1) *CF assumes that each FM translator precludes an LPFM station which the Commission has recognized is not the case.* CF clearly prefaces the study by stating that we “assumed in this study that LPFM will be utilizing contour-based

methodology in the future and not distance spacing placement.” Within the LPFM Order, FCC stated that it “tentatively conclude[s] that the licensing of LPFM stations pursuant to the standards of Section 74.1204 of the Rules or some other ‘contour-based’ methodology is in the public interest.”⁵ The NPR assertion would be correct if CF was referring to LPFM distance spacing, but since the FCC has proposed contour spacing to be a legitimate option for LPFM in the future, a clear 1:1 technical preclusion is indeed possible.

- 2) *The very precise percentages and figures highlighted in the CF Study are the product of a simulation that assumes which ten applications the remaining translator applicants with more than ten pending applications would select.* The assertion that CF’s study is one of many possible permutations, as CF had stated in its original comment, should be obvious. The real outcome could be *better or worse* for LPFM. In a real world translator selection scenario, each individual translator applicant would be able to make the most calculated move with the help of a professional engineer and lawyer. In addition, any added settlement and technical modification window could be to the advantage of the translator applicant. CF’s study does not approach this highly honed level of scrutiny for selection, meaning, CF’s study may even be a conservative prediction of the ten cap’s impact on urban spectrum availability.
- 3) *“It is unreasonable to assume that every applicant would ‘gravitate to more populated area’.... Indeed, the ten application limit could produce myriad variations in actual practice, with far less drastic consequences than the one possibility featured in the CF Study”.* CF clearly states “protected applications were selected in our study in a manner intended to (A) to spread an applicant’s applications out channel-wise (if an applicant has several applications in one MX, only one application needs to be selected for protection in that MX), and (B) gravitate to more populated areas (based on the premise that applicants will realize frequencies in densely populated areas are less likely to be available in future translator filing windows).” Far from random, this ideology is pragmatically based upon sound legal and engineering advice.
- 4) *“Apart from relying on pure conjecture, CF assumes that no applicant would use a new translator station to serve the public interest. In fact, there are a number of public radio broadcasters that filed one or a few applications with the intent of filling coverage gaps or extending service to adjacent areas.”* CF believes that new local service is of chief importance in central urban areas, and redundant or relayed service is of secondary importance when identical services currently exist. As for towns further from the cities, in rural areas that do not already have public radio service, we concur that added public service, such as NPR, is beneficial. NPR provided three examples of mutually exclusive translator applications that their affiliates are waiting upon:

University of Washington: Two redundant pending translator applications (same coordinates) to possibly strengthen KUOW’s signal in Olympia, WA, 50 miles south of Seattle, within KUOW’s 54 dBu F(50,10) contour. KXOT Tacoma, programmed by KUOW, also serves Olympia. Another public radio service, KPLU, also serves Olympia.

⁵ Paragraph 83, *LPFM Order*.

These translators are not immediate to Tacoma/Seattle. These pending translators do not concern CF's study.

Board of Regents of the University of Wisconsin System: Two Auction No. 83 translators were already granted. A pending one for Madison, WI is duplicative in coverage to a translator *Regents* was previously granted for Madison from Auction No. 83 (W300BM). Madison is also served by public radio via WERN and W215AQ. The other pending translator is for Janesville, WI, which CF would consider rural.

Iowa State University of Science and Technology: One translator application appears granted and then deleted. One was dismissed. Two appear to be pending for rural towns, and one is pending for Des Moines, served also by NPR station WOI.

Whether or not NPR should have multiple and/or duplicative radio services in certain areas is beyond the scope of CF's study. What is clear, however, is that according to a map produced by NPR Labs, NPR has firmly established, or even multiplicative coverage (2x, 3x+) in the top 150 radio markets (see **Appendix B**). NPR affiliates' pending translators for extending and filling-in coverage to areas in need are outside the core urban areas and should not be at risk of "no frequency" availability in the proposed EMF/Prometheus Joint Memorandum.

Although NPR critiques multiple points in CF's study, it provides no new data or methods to better predict the efficacy of the processing cap, nor does it look for common ground to expedite translator processing, as EMF and Prometheus have ventured. CF believes that our rigorous presentation predicts a real world possible outcome down to each application in each labeled MX.

Regarding Comments of Twenty-One Commercial Broadcasters

The October 7, 2010 letter in MM Docket No. 99-25 from Twenty-One Commercial Broadcasters ("TOCB") proposes an alternative to the EMF/Prometheus Joint Memorandum approach that is more commercial translator centric. TOCB recommends that the FCC open a settlement window, followed by a commercial translator auction, with NCE translator applications frozen until after an LPFM window. The major argument given by TOCB for this alternative proposal is that the majority of pending translators are NCE in nature. Allowing the commercial broadcasters to go to auction would then purportedly result in less of a preclusive impact to proposed LPFM service than enacting a ten application processing cap.

While the arrangement may be palatable to certain parties, the reality is that there could be more of a preclusive impact in select markets than suggested by TOCB. For example, within CF's original comment we demonstrated a simulation of the Los Angeles market. In that simulation, commercial broadcasters ended up with not only all the open channels, but possibly multiple translators per each commercial applicant (page 11, CF letter/study). In another example in the Fresno market, one single applicant could claim ten translators in the same market. **In utilizing this processing regimen, an MX only needs one commercial applicant for that channel to be claimed by a translator applicant.** At the end of all translator licensing, markets could be asymmetrically licensed as chiefly commercial translator

cities or LPFM/NCE translator towns. The overall outcome could be at odds with the FCC's goal of fair distribution of transmission and reception service.

Comments of RFEEngineers and CircuitWerkes, Inc.

The November 5, 2010 letter in MM Docket No. 99-25 from RFEEngineers and CircuitWerkes ("RFE") proposes a complex multi-step approach for solving translator MXs. While the comment vacillates back and forth, both agreeing and disagreeing with LPFM and translator advocates at times, it provides no new data to demonstrate how the RFE proposed processing method would turn out. RFE proposes a local "cap of four overlapping applications per community" (page 6) but again provides no numbers as to how this would impact LPFM availability or diversity of ownership for translators. CF is unsure how this method may work in translator application impacted cities. For example, Los Angeles metro MX groups consist of 15 unique (not *total*) applicants. From our study above, we see that eight translators could be placed in the core metro. Even if each translator applicant is only allowed to pick one single translator to be processed in this market, it is plausible that roughly half the unique applicants will not be granted translators, and still no channels will be left for LPFM. In the New York metro MXs there are 33 unique (not *total*) applicants and roughly 15 open translator spots in the area of the core metro. Any combination cap and settlement window could consume all these available channels in one swoop.

RFE states "while Prometheus' assertion that there will be no frequencies available could be correct in some specific communities, we believe that the problem is very limited and it is not generally true across the entire country." Again, RFE provides little if anything to substantiate this claim. CF agrees that each market has its own mix of commercial and noncommercial applicants, and is impacted differently by the number and type of each applicant. Yet this does not mean that the problem for LPFM would be limited to a certain abnormal type or size of market. In a previous comment CF showed that Ithaca, NY, which is market 285, was more frequency-impacted than certain markets in the top 100. Some markets are flooded with previously licensed translators and some are not.

Finally, RFE states "it is unreasonable and unfair to have applications from an earlier filing window displaced by a later one...Changing the rules on these applicants more than 7 years after they paid for the processing of their applications would be unconscionable."

RFE fails to recall that the LPFM processing rules were additionally changed mid-processing. LPFM filing windows were opened in 2001 (see Public Notices DA 01-904, DA 00-2831), the FCC then changed Section 73.807, announced Auction No. 83 for translators (see Public Notice DA 03-359), and dismissed 36 pages full of LPFM applications (see Public Notice DA 07-794). Later still, LPFM third adjacent concerns were exonerated by the "MITRE study" (see Public Notice DA 03-2277), but translators continued to be processed. **Large amounts of LPFM applications were dismissed regardless. Many Auction No. 83 translators went on to be processed, then licensed in many cities today. Because of all this, CF believes that it may be unreasonable for translators to continue to lay first claim to the most coveted urban secondary service channels merely by default.**

It is difficult to predict the effects of RFE and TOCB's alternative proposals without more data. Both would appear more liberal in execution for commercial translator applicant processing compared to the EMF/Prometheus proposal, and thus may be problematic by precluding urban LPFM opportunities.

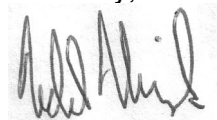

Conclusion

The LPFM Order has stated that processing the remaining translator applications “would frustrate the development of the LPFM service.” Thus the Commission itself has acknowledged that too few open channels exist outside the pending translator MXs and then “support[s] the adoption of some remedial measures.” **If the remedial measure—the ten application processing cap—is shown to have little effect on freeing up additional channels within the urban MXs, that remedial measure must be adapted to accomplish the stated goals of the order.** CF's previously submitted 206-page study is so far the most rigorously researched assessment concerning a real world outcome of the application processing cap. The study presented here only confirms the Commission's own assertions that the development of urban LPFM service is hinged upon the outcome of Auction No. 83.

Without an effective “remedial measure,” LPFM applicants could be faced not only with very few channels compared to translators, but with channels that are not viable due to interference concerns. In addition to channel quantity, channel quality is an issue. In a city like Portland, Oregon, where nine existing commercial translators already are licensed, CF feels that LPFM should be given the next available chance for channel licensing before seven more translator applicants could reserve frequencies—a possible outcome of the proposed ten application processing cap. Such an unbalanced outcome does not meet the Commission's goals for localism, diversity, and competition on the airwaves. LPFM hopefuls have waited ten years for a chance to serve their communities, and any resolution of Auction No. 83 applications must preserve opportunities for LPFM's future.

It is unclear how RFE and TOCB's alternative processing proposals would fare in relation to the goals for LPFM expressed in the LPFM Order. Any newly proposed processing strategy should follow the intent of the order by preserving spectrum availability for a future LPFM application window. We continue believe that the EMF/Prometheus Joint Memorandum would best serve as this remedial measure.

Sincerely,

Todd Urick
Technical Director,
Common Frequency
